**Title:** Create a product cipher.

**Problem Definition:** Design and implement a product cipher using S-box, D-box and few other components of a Modern Block Cipher.

**Pre-requisite:** Modern Block Ciphers

**Theory:**

**Product cipher**, data encryption scheme in which the ciphertext produced by encrypting a plaintext document is subjected to further encryption. By combining two or more simple transposition ciphers or substitution ciphers, a more secure encryption may result.

Product cipher is a combination of these six methods

1. Substitution
2. Transposition
3. Split and Combination
4. X-OR
5. Shift (Left/Right)
6. Swap

**Procedure/ Algorithm/ Design:**

Process for Encryption

Step 1: Take a message from user Step

2: Split the message in group of 5Step 3:

Use substitution of each group

Step 4: Apply Transposition to each group and then combine

## Program Code with Results:

```
productCipher.py > ...
1  k = [3,1,4,5,2]
2  ki = [2,5,1,3,4]
3  kc = 3
4  alpha = 'abcdefghijklmnopqrstuvwxyz'
5  msg = input("Enter the message: ")
6  msg = "".join(msg.split())
7  enc = ""
8  dec = ""
9
10 while len(msg)%5 != 0 :
11     msg = msg + "x"
12 for i in msg :
13     enc = enc + alpha[(alpha.find(i)+kc)%26]
14 print("After encryption with Caesar Cipher:",enc)
15 msg = enc
16 enc = ""
17
18 mat = [["x" for i in range(5)] for j in range(int(len(msg)/5))]
19 print("Transposition Matrix: ")
20 for i in range(int(len(msg)/5)) :
21     for j in range(5):
22         print(msg[i*5+j], end=" ")
23     print()
24 for i in range(5) :
25     for j in range(int(len(msg)/5)) :
26         if j*5+k[i]-1 < len(msg) :
27             mat[j][i] = msg[j*5+k[i]-1]
28 enc = ""
29 for i in range(5) :
30     for j in range(int(len(msg)/5)) :
31         enc = enc + mat[j][i]
32 print("Final Encrypted Message:",enc.upper())
33
34 for i in range(5) :
35     for j in range(int(len(enc)/5)) :
36         mat[j][i] = enc[i*(int(len(enc)/5))+j]
37 enc= ""
```

```
34 for i in range(5) :
35     for j in range(int(len(enc)/5)) :
36         mat[j][i] = enc[i*(int(len(enc)/5))+j]
37 enc= ""
38 for i in range(int(len(msg)/5)) :
39     for j in range(5) :
40         enc = enc + mat[i][ki[j]-1]
41 for i in enc :
42     dec = dec + alpha[(alpha.find(i)-kc)%26]
43 print("Decrypted Message:",dec)
```

## Output:

```
Decrypted Message: killprimeministerxxx  
PS E:\Network-Security-Scanner> python productCipher.py  
Enter the message: kill prime minister  
After encryption with Caesar Cipher: nloosulphplqlvwhuaaa  
Transposition Matrix:  
n l o o s  
u l p h p  
l q l v w  
h u a a a  
Final Encrypted Message: OPLANULHOHVASPWALLQU  
Decrypted Message: killprimeministerxxx  
PS E:\Network-Security-Scanner> 
```
